Anti-Cyclin D1 [E3P5S]

Catalog No.	Description		
ANA20-5M	6 ml of Ready-to-Use Antibody for use with BioGenex Super Sensitive TM Detection		
	Systems OR equivalent detection system 10 ml of Ready-to-Use Antibody in a		
ANA20-10M barcode labeled vial for use with BioGe Super Sensitive TM Detection Systems at i6000 TM Automated Staining Systems			
NUA20-UC	1 ml of Concentrated Antibody for use with BioGenex Super Sensitive TM Detection		
	Systems OR equivalent detection system		
NUA20-5UC	0.5 ml of Concentrated Antibody for use with BioGenex Super Sensitive TM Detection		
	Systems OR equivalent detection system		
AYA20-YCD	Ready-to-Use Antibody in Barcode labeled vial for use on the Xmatrx [®] Elite/Ultra		
	Staining System, 160 tests		
AYA20-50D	Ready-to-Use Antibody in Barcode labeled vial for use on the Xmatrx® Elite/Ultra Staining System, 50 tests		

Clone	Species	Ig Class
E3P5S	Rabbit	IgG

Intended Use

For In Vitro Diagnostic Use. This antibody is designed for the specific localization of Cyclin D1 in formalin-fixed, paraffinembedded (FFPE) tissue sections. Evaluation must be performed by a qualified pathologist.

Summary and Explanation

Cyclin D1 belongs to the Cyclin D family. Cyclin D1 is required for the cell cycle G1/S transition. Cyclin D1 forms a serine/threonine kinase holoenzyme complex with and functions as a regulatory subunit of CDK4 or CDK6. Cyclin D1 also phosphorylates and inactivates the retinoblastoma protein and promotes progression through the G1/S phase. Amplification or overexpression of cyclin D1 plays a pivotal role in the development of various human tumors including parathyroid adenoma, breast tumor, colon tumor, lymphoma, melanoma and prostate tumor. Cyclin D1 also associates with and regulates the activity of transcription factors, coactivators and corepressors that govern histone acetylation and chromatin remodeling proteins.

Storage and Handling

Store at 2-8°C. Fresh dilutions, if required, should be prepared prior to use and are stable and steady for up to one day at room temperature (20-26°C). Diluted antibody preparations can be refrigerated or frozen for extended shelf life.

Principles of the Procedure

Antigen detection by immunohistochemistry (IHC) is a two-step process wherein the primary antibody binds to the antigen of interest and that binding is detected by a chromogen. The primary antibody may be used in IHC using manual techniques or BioGenex Automated Staining System. Positive and negative controls should always be run simultaneously with all patient specimens.

Reagents Provided

Rabbit Monoclonal Antibody Cyclin D1 is affinity purified and diluted in PBS, pH 7.2, containing 1% BSA and 0.09% sodium azide.

Dilution of Primary Antibody

BioGenex Ready-to-Use antibodies have been optimized for use with the recommended BioGenex Detection System and should not require further dilution.

BioGenex concentrated antibodies must be diluted in accordance with the recommended protocol when used with the recommended BioGenex Detection System.

Recommended Protocol

Refer to the following table for conditions specifically recommended for this antibody. Refer to the BioGenex website for guidance on specific staining protocols or other requirements.

Parameter	BioGenex Recommendations		
Control Tissue	Breast Carcinoma as available with Biogenex FB-A20N* & FG-A20N*		
Recommended Dilution for Concentrated Antibody	1:20-50 in HK941		
Recommended Pretreatment (Manual/i6000)**	EZ-AR2 (HK522-XAK)		
Recommended Pretreatment (Xmatrx)	EZ-AR2 Elegance (HX032-YCD)		
Antibody Incubation (Manual/i6000)	30-60 min at RT		
Antibody Incubation (Xmatrx)	30-60 min hr at 25°C		
Detection System for Manual, Xmatrx & i6000 systems***	Use BioGenex Two-Step OR One-Step Super Sensitive TM Polymer-HRP IHC Detection System/DAB; see p. 2 for more information		

*FB: positive control barrier slides, FG: positive control nonbarrier slides. Xmatrx requires barrier slides.

Pretreatment times will vary based on individual microwave power. *For automation systems (Xmatrx-Elite, Xmatrx-Ultra & i6000 Diagnostics), refer to the factory protocols provided with the instrument.

Precautions

This product contains sodium azide at concentrations of less than 0.1%. Sodium azide is not classified as a hazardous chemical at the product concentrations, but proper handling protocols should be observed. For more information, a Safety Data Sheet (SDS) for sodium azide is available upon request. Dispose of unused reagents according to Local, State and Federal Regulations. Wear suitable Personal Protective Equipment, do not pipette reagents by mouth, and avoid contact of reagents and specimens with skin and mucous membranes. If reagents or specimens come in contact with sensitive area, wash with copious amounts of water.

Quality Control

Refer to BioGenex detection system documents for guidance on general quality control procedures.

Troubleshooting

Refer to the troubleshooting section in the documentation for BioGenex Detection Systems (or equivalent detection systems) for remedial actions on detection system related issues, or contact BioGenex Technical Support Department at 1-800-421-4149 or support@biogenex.com or your local distributor to report unusual staining.

Expected Results

This antibody stains nucleus in positive cells in formalin-fixed, paraffin embedded tissue sections. An example image of a tissue section stained with this antibody can be found on the product page on the BioGenex website. Interpretation of the staining result is solely the responsibility of the user. Experimental results should be confirmed by a medically-established diagnostic product or procedure.

Limitations of the Procedure

Improper tissue handling and processing prior to immunostaining can lead to inconsistent results. Variations in embedding and fixation or the nature of the tissue may lead to variations in results. Endogenous peroxidase activity or pseudo peroxidase activity in erythrocytes and tissue biotin may result in non-specific staining based on the detection system employed. Tissues containing Hepatitis B Surface Antigen (HBsAg) may give false positive with horseradish peroxidase systems. Improper counterstaining and mounting may compromise the interpretation of results.
